

Elvis T. Harmon

MASTER PROJECT PROMPT — ADVANCED DJANGO SOFTWARE ENGINEER PORTFOLIO

Build a complete, production-ready, modern personal portfolio platform for a software engineer named Elvis T. Harmon. The portfolio must NOT be a simple static website. It must be a full-stack Django web application with a premium frontend, PostgreSQL database, dynamic content management, analytics, GitHub integration, AI portfolio assistant, blog system, contact/lead management, and a secure administration dashboard.

Technology stack and requirements include Python, Django, Django REST Framework, PostgreSQL, Django authentication/ORM, Django templates, HTML5, CSS3, Bootstrap 5 or Tailwind CSS, Vanilla JavaScript, Chart.js, responsive design, GitHub API, email service, AI/LLM API, Cloudinary or S3-compatible storage, analytics integration, deployment via GitHub and Render/Railway, HTTPS, environment variables, and production security configuration.

Main objective: present Elvis as a professional software engineer and demonstrate real-world full-stack system building. UI must be modern, professional, minimal, fast, responsive, accessible, SEO-friendly, easy to navigate, and visually impressive without excessive animations.

Public website sections requested: Home, About, Projects (search/filter), Project Case Study, Experience timeline, Education, Certifications, Services, Blog, Contact form with PostgreSQL storage and email notifications.

AI assistant requested: “Elvis AI Assistant,” retrieval-based from portfolio database, suggested questions, no fabricated claims, clear notice it is not human.

GitHub integration requested: public repositories, metadata, synchronization, featured repos, stats, recent activity; no private data exposure.

Additional requested systems: developer statistics, database-driven CV with downloadable PDF, custom admin dashboard, CRM-style contact/lead management with statuses, privacy-conscious analytics, normalized PostgreSQL models, security hardening, SEO implementation, responsive design, performance optimization, premium UI/UX standards, placeholder project structure, code quality standards, testing coverage, and production deployment prep.

Development approach requested in 7 phases from core setup through deployment, keeping app runnable at every phase.

Final quality standard emphasizes recruiter usability and demonstration of skills in Python, Django, PostgreSQL, REST APIs, AI/ML, frontend, database design, auth, security, API integration, testing, deployment, software architecture, and UI/UX.
